To pass 80% or
higher

1. What is the resolution of o the 70,000 images from the Fashion MNIST dataset?

- ☐ 28x28 Color
- ☒ 28x28 Greyscale
- ☐ 82x82 Greyscale
- ☐ 100x100 Color

✔ **Correct**
Spot on!

2. Why are there 10 output neurons in the Neural Network used as an example for the Computer Vision Problem?

- ☐ To make it train 10x faster
- ☐ To make it classify 10x faster
- ☒ There are 10 different labels
- ☐ Purely arbitrary

✔ **Correct**
Exactly! There are 10 output neurons because we have 10 classes of clothing in the dataset. These should always match.

3. What does Relu do?

- ☐ It returns the negative of x
- ☐ It only returns x if x is less than zero
- ☐ For a value x, it returns 1/x
- ☒ It only returns x if x is greater than zero

✔ **Correct**
Correct! The rectifier or ReLU (Rectified Linear Unit) activation function returns x if x is greater than zero.

4. Why do you split data into training and test sets?

- ☒ To test a network with previously unseen data
- ☐ To make training quicker
- ☐ To train a network with previously unseen data
- ☐ To make testing quicker

✓ **Correct**

Nailed it! Splitting the data into training and test set allows you to test the network with unseen data.

5. True or False: The `on_epoch_end` function sends a logs object with lots of great information about the current state of training at the start of every epoch

- ☒ False
- ☐ True

✓ **Correct**

Absolutely! The function activates at the end of every epoch

6. Why do you set the `callbacks=` parameter in your fit function?

- ☐ So that the training loops performs all epochs
- ☐ Because it accelerates the training
- ☒ So, on every epoch you can call back to a code function

✓ **Correct**

That's right! You can have it check the metrics and stop the training.
